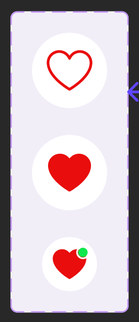
FEEDBACK

The Like Icon needs a greater visual weight. Easy to attract users attention



Moving it to the left side of the image container makes it easier to read. Jakob's Law also applies: users are familiar to find that Like Button align to the left on similar websites/apps.

When images are at the center of a UI, they should have the greatest visual weight. Thus, my choice of making it justify center and align middle.

Be careful with color contrast ratio.Especially on items that have a high impact on user's xp, e.g. Menu Items.

Would suggest more towards a better off-black color than a gray color on this.

When making the selected state of a button or link, it is a good accesibility practice to reinforce color change with a visual element, e.g. selected state:

Food & Drink + a color change

It is always recommended when using UI cards to have a contrast between background and the card.

card-color: #FFFFFF

bg-color: #F5F5F5

Also, notice the subtle outline on each card that helps with the contrast of colors.

border: 1px #E6E6E6

Spatial System: Uniformity on a spatial level allows your product to be more consistent. When I design, every piece of a UI elements is bound to a "8px grid". This gives a lot of cleanliness, rhytm, and harmony to designs.

2x2 4x4 8x8 16x16 24x24 etc

FEEDBACK

Close button always required.

Border Radius has been removed on this view.

If you are planning to put a modal, then a black background with opacity needs to be added. That way you help users focus on the modal and gives that correct sensation that the modal is on top of the main page.
